

BSc (Hons) in **Computer Science****SE3062 : Intelligent Systems**

Year 3 · Semester 1 · 2026 Semester 2

Faculty of Computing**Practical 01**

Objective & Lecture Mapping: Recall that an intelligent agent acts within a continuous loop: Sensors generate percept sequences, and Actuators execute actions to maximize a Performance measure. Use this sheet to execute practical modifications and incrementally evaluate your design against Lecture 01 and 02 theory (from basic recall to analytical classification).

Part 1: Code Analysis & PEAS Evaluation**Task 0 : Setting up and getting the starter Code**

1. Go to the [Git Hub Repo](#). Create a Fork of this Git Repo to your Personal Github Profile. Open it using your favourite IDE and follow the below instruction to complete the practical. The base code is in the "master" brach of the repo.

Task 1.1: The Environment State (__init__)

1. (Remember) List the four components of the PEAS framework discussed in Lecture 01.

Performance Measure, Environment, Actuators, Sensors

2. (Understand) Look at the `VisualGridHuntGame.__init__` method. Which specific variables in this code represent the physical "Environment (E)" state?

grid_size, self.walls, self.food, and self.opponents

3. (Analyze) Based on the variables initialized (specifically `self.opponents`), classify this baseline environment as "Single-Agent" or "Multi-Agent". Briefly justify your choice.

Multi-Agent. It is multi-agent because `self.opponents` defines other active entities in the environment that can interact with or compete against the primary agent.

Task 1.2: The Perception Subsystem (`get_percept`)

4. (Remember) Define what a "percept sequence" is according to Lecture 01.

A percept sequence is the complete history of everything the agent has perceived through its sensors up to the present moment.

5. (Understand) Which component of the PEAS framework does the `get_percept()` method represent in our code?

Sensors (S)

6. (Evaluate) Based on the exact dictionary returned by `get_percept()` , is this environment "Fully Observable" or "Partially Observable"? Explain why based on what the agent can and cannot see.

Partially Observable. The agent only receives local sensor data from the dictionary instead of seeing the complete global state of the entire grid at all times.

Task 1.3: Action Execution (`execute_action`)

7. (Understand) When `execute_action()` deducts points for hitting a wall, which PEAS component is being actively updated?

Performance Measure (P)

8. (Evaluate) Why is it structurally important that this metric evaluates changes in the external environment state (hitting a wall) rather than the agent's internal processing effort?

The performance measure must evaluate the actual outcome achieved in the environment rather than internal computational effort, otherwise the agent could be rewarded for wasteful thinking without achieving the task.

Part 2: Guided Modification & Deep Theory Mapping

Follow the implementation instructions to inject a new hazard, then answer the questions to map your code changes back to the theoretical nature of the environment.

Step 2.1: Extending the Environment Initialization (`__init__`)

1. **Implementation Instructions:** Declare a new trap collection attribute (e.g., `self.toxic_traps = set()`) inside `__init__`. Populate it with coordinate tuples safely avoiding position `(0, 0)`, walls, and food.

9. (Understand) If you successfully add `self.toxic_traps` to the environment but intentionally **hide** this data from the agent's sensors, how does this specifically alter the environment's "Observability" classification?

It makes the environment partially observable because there are hazard states in the physical world that the agent cannot detect through its percepts.

Step 2.2: Updating the Perception Subsystem (`get_percept`)

1. **Implementation Instructions:** Locate `get_percept(self)` and add a new boolean sensor key (e.g., `'smells_toxin': tuple(self.agent_pos) in self.toxic_traps`) to the dictionary returned to the agent loop.

10. (Analyze) By adding `'smells_toxin'`, you expand the agent's percept sequence. Explain how this specific sensor helps the agent act with "Rationality" (maximizing expected utility).

Rationality means choosing actions that maximize expected score based on percepts. Knowing that a toxin is present allows the agent to anticipate the 15 point penalty and choose a safer action to maximize utility

Step 2.3: Modifying Action Execution & Visual Rendering (`execute_action` & `draw_grid`)

1. **Implementation Instructions:** In `execute_action`, check if the updated `self.agent_pos` intersects with `self.toxic_traps` to decrement `self.score` by 15 points. In `draw_grid`, iterate through traps to render custom purple shapes on the canvas.

11. (Remember) You programmed a severe score penalty for stepping on a trap to avoid metric exploitation. What was the classic "Vacuum World Exploit" example discussed in Lecture 01 that illustrated the danger of faulty metrics?

If the vacuum agent is rewarded for every piece of dirt cleaned, it can clean up dirt, dump it back out onto the floor, and clean it again repeatedly to earn infinite points instead of keeping the room clean.

Finalize and Lock Lab 01 Analytical Evaluation
